

WEEKLY REPORT

WEEK 1

During the first week, our team explored and discussed various project ideas based on current technological trends and real-world applications. Based on our discussions, we prepared and submitted three different project abstracts for evaluation. After reviewing the proposed ideas based on their relevance, feasibility, innovation, and potential impact, one of the three abstracts was selected and finalized as our project topic. The selected project focuses on developing an **AI-Based Cardiovascular Disease Detection Using CNN** to automatically analyze heart-sound recordings obtained from digital stethoscopes and support healthcare professionals in early cardiovascular screening.
